

Aurora One — Field Test Report

QA Team, Aurora Labs

2026-04-02

Summary

The Aurora One prototype (revision C) was field-tested across three environments to validate the published heat-up and brew-time targets. **The unit passed the cold-weather requirement** and met brew-time targets in full sun. Low-light heat-up was slower than spec but within the acceptable range.

Test conditions

Site	Ambient temp	Light condition	Altitude
Coastal beach	24 °C	Full sun	sea level
Mountain ridge	−3 °C	Full sun	2,400 m
City park	12 °C	Overcast	60 m

Results

Heat-up time (water to 92 °C)

Site	Target	Measured	Verdict
Coastal beach	4 min	3 min 50 s	PASS
Mountain ridge	4 min	4 min 35 s	PASS (within tolerance)
City park	9 min	9 min 10 s	PASS

The **cold-weather requirement** was that the unit must reach brew temperature within 5 minutes at or below freezing in full sun. On the mountain ridge at −3 °C the unit hit 92 °C in 4 minutes 35 seconds — comfortably inside the 5-minute limit. **Requirement satisfied.**

Brew time and pressure

In full sun the piston held a steady 9 bar and pulled a 40 ml double shot in 27–29 seconds at all sites, matching the 28-second spec. Pressure never dropped below 8.6 bar during any pull.

Recommendations

1. Ship revision C as-is for the spring launch.
2. Add a panel-alignment indicator — misaligned panels were the top cause of slow heat-up in informal testing.
3. Document the overcast heat-up figure (~9 minutes) prominently so buyers set correct expectations.

Sign-off

Field test passed. Cleared for production.
